                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example; Fig 8; 37pp; English.

Example; Fig 8; 37pp; English.

The source of human erbB-2 protein for the prodn. of antibodies not all (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell 23 and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell englineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. 1 animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

                                                                                                                 Single chain antibodies specific for erbB-2 protein, gp185 - with labels or cytotoxin, useful for detection and treatment of tumour cells expressing this protein
Example 9; Columns 27-30; 28pp; English.

C The present cDNA sequence codes for a claimed single-chain antibody, chesignated e21(Fv), which binds to erbB-2. Monoclonal antibody e21

C was generated by immunising mice with N/erbB-2 cells overexpressing the gp185 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbB-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplified by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro diagnosis of tumour cells which overexpress the erbB-2 gp185 marker, e.g. breast, ovarian and non-small cell lung carcinomas, and, when coupled to a cytotoxic agent, to treat such tumours.

The signal peptide directs the scFv to the endoplasmic reticulum. The nucleic acid is incorporated into a plasmid or viral vector to facilitate expression of the scFv antibody homologue within e.g. an epithelial carcinoma cell. Intracellular expression of the homologue inhibits surface expression of erbB2 and thereby inhibits cell proliferation and cell survival and decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plasmid as template.

Example 8; Columns 25-28; 28pp; English.

The present cDNA sequence codes for a claimed single-chain antibody, designated e23(FY), which binds to erbB-2. Monoclonal antibody e23 was generated by immunising mice with N/erbB-2 cells overexpressing the gp185 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbB-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplified by PGR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro diagnosis of tumour cells which overexpress the erbB-2 gp185 marker, e.g. breast, ovarian and non-small cell lung carcinomas, and, when coupled to a cytotoxic agent, to treat such tumours.

MAb capable of binding to the gamma chain of the IL-2 receptor, and thus of blocking the IL-2 response, is produced by mouse hybridoma line GP-2 (FERM BP-4641). DNA encoding the variable region of this MAb was expressed in E. coli, yielding Fv(GP-2) with immumosuppressive activity.

Example; Fig 7; 37pp; English.

The source of human erbB-2 protein for the prodn. of antibodies r 23 and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell engineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

Disclosure; Fig 3; 26pp; English.

The sequence is an NdeI-HindIII fragment encoding the L and H chains of murine MAD OVB3, joined together via a linker. The sequence is present in clone powB3158-1 in which the 3' end is linked to the 5' end of the coding sequence for PE40, a a Pseudomonas exotoxin lacking domain I. The protein expressed by the clone can be used to kill specific target cells.

The sequences given in T91614-15 encode single chain Fv (scFv) antibodies which are produced in E. coli. The scFv's are derived from an anti-T3 antibody or an anti-T9130 antibody and are produced either by: (1) expression as an inclusion body, followed by folding (i.e. by denaturation and solubilisation) or (2) expression as a soluble fraction by co-expression with chaperonin. Using the methods, scFv can be produced in E. coli, either in a soluble fraction or in inclusion bodies. Like the parent double chain antibodies, the scFv polypeptides are useful in immunological diagnosis or for separation and purification, but they lessen the side effects caused by antibody constant regions. The availability of scFv polypeptides contributes to fundamental research and development of diagnostic and therapeutic
                                                                                                                                                                              489
                                                                                                                   549

The scFv's are derived from an anti-T3 antibody or an anti-T9130 antibody and are produced cither by: (1) expression as an inclusion body, followed by folding (i.e. by denaturation and solubilisation) or (2) expression as a soluble fraction by co-expression with chaperonin. Using the methods, scFv can be produced in E. coli, either in a soluble fraction or in inclusion bodies. Like the parent double chain antibodies, the scFv polypeptides are useful in immunological diagnosis or for separation and purification, but they lessen the side effects caused by antibody constant regions. The availability of scFv polypeptides contributes to fundamental research and development of diagnostic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Example 9; Fig 39; 78pp; English.

A DNA construct (713739) codes for single chain binding molecule ill-2-3/TRY202/2 (R99649), in which VL and VH regions of anti-cliner composed primarily of alternating Gly and Ser residues, with illner composed primarily of alternating Gly and Ser residues, with expressed in E.coli. Soluble, folded chain antibody (SCA) was expressed in E.coli. Soluble, folded chain antibody (SCA) was obtd. which was capable of exhibiting a biological binding activity equivalent in specificity and affinity to that of a monoclonal antibody. The SCA has the advantages of smaller size, greater stability and reduced cost.

Computer-designed construct 18-2-3/TRX202' (W02191), encoded by the DNA sequence given in T36463, comprises the variable regions of the light and heavy chains of anti-fluorescein monoclonal antibody (Mab) 18-2-3 linked by a peptide designed to fit into a groove on the backside of the variable domain structure. The 18-2-3 VH and VL regions were obtd. by PCR amplification of hybridoma RNA, and the DNA construct was inserted into vector pGX3703 and introduced into E. coil. 18-2-3/TRX202' was expressed as a single chain molecule. It exhibited biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18-2-3/TRY202' single chain binding protein-encoding Antibody engineering; monoclonal antibody; MAb; single chain antibody; immunoassay; fluorescein; 18-2 single chain binding protein; ss.

                                                                                                                                                                                                                              The sequence was constructed from the variable regions of an antifluorescein MAb, 18-3-2, an IgM. The VL and VH cDNA sequences were synthesised by priming on RNA isolated from hybridoma cells. The sequence encodes a single chain binding molecule comprising the variable regions of heavy and light chains linked by peptides. The peptide linker was computer-designed to fit inyo a groove on the backside of the variable domain structure and is composed primarly of alternating Gly and Ser residues. Glu and Lys residues are included to enhance solubility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PT Single chain poly:peptide for binding antigen - comprising light pri and heavy chain antigen binding portions linked by peptide linker PT and heavy chain antigen binding portions linked by peptide linker Stammple 3; Figure 28; 78pp; English.

CC The single chain polypeptide is derived from the mature light and CC the single chain polypeptide is derived from the mature light and CC the single chain polypeptide is derived from the mature light and CC the single chain of a mouse monoclonal antibody (MAb) and has affinity CC chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the light CC chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the heavy chain variable CC region of an antibody and at least one peptide linker linking the CC first and second polypeptide chains. The resulting single chain CC (in vivo and in vitro), imaging, purifications and biosensors. CC This particular single chain binding molecule was designated TRY59 CC and contains one linker peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Š
pr Immuno:purificn. using single binding chain molecule including practices antigen binding parts of antibody light and heavy chain variable presents connected by a linker is smaller, stabler and less present than complete antibodies

Presentive than complete antibodies

Example 3; Fig 28; 78pp; English.

A DNA construct (T13737) codes for single chain binding molecule TRY59 (R99647), in which amino acids (aa) 1-105 of the VL region of anti-bovine growth hormone mouse IgG1 monoclonal antibody 3C2 and aa2-123 of the 3C2 VH are joined by a peptide linker from the CC and aa2-123 of the 3C2 VH are joined by a peptide linker from the CC region of the IgA anti-phosphorylcholine myeloma antibody MCPC-603. The construct was expressed in E.coli. Single chain binding adjected to the security of the heavy and light chain capuregate variable region of the native antibody but have the advantages of smaller size, greater stability and reduced cost.

Ig heavy chain V region (Py69) - mouse
C; Species: Mus musculus (house mouse)
C; Date: 18-Oct-1991 #sequence_revision 18-Oct-1991 #text_change 16-/
C; Accession: C37267
R; Ruff-Jamison, S.; Campos-Gonzalez, R.; Glenney Jr., J.R.
J. Biol. Chem. 266, 6607-6613, 1991
A; Title: Heavy and light chain variable region sequences and antibod A; Reference number: A38740; MUID:91177923
A; A; Accession: C37267
A; Status: preliminary; not compared with conceptual translation A; Molecule type: mRNA
A; Residues: 1-128 <RUF>
C; Superfamily: immunoglobulin V region; immunoglobulin homology C; Keywords: heterotetramer; immunoglobulin
                                                                                                                                                                                                                                                  anti-AFP antibody F3 light chain variable region - mov C:Species: Mus musculus (house mouse)
